Array-RevHW

Create a program with a button and two list boxes to process a text file of integers.

The button should perform the following steps:

1. Show an OpenFileDialog for the user to select the file.
   a. Write a method to call the OpenFileDialog.
   b. Display an error message if needed.

2. Read the text file of integers into an array.
   a. Write a method to read the file into the array.
   b. Display the integers in the first list box.
   c. Display an error message if the file was not read.

3. Convert the integers into words in another array.
   a. Write a method to loop through the integer array.
   b. For the values 1 through 5, store the word "one", "two," etc., in the corresponding element of the second array.
   c. If the integer is less than 1, store the word "lower."
   d. If the integer is more than 5, store the word "higher."
   e. Display the words in the second list box.

4. Save the word array in another text file.
   a. Write a method to show a SaveFileDialog.
   b. Write another method to save the array to the file entered by the user.
   c. Display error messages as needed.
